Acry Smart is the innovative system of acrylic resin artificial teeth which will bring the future into your job. Versatile, resistant and aesthetically natural which will enable you to obtain excellent results. Behind the most natural smile we have placed the most intelligent technology.

Use Acry Smart for:
- Complete prostheses;
- Over dentures;
- Toronto Bridges;
- Bar prostheses.

Functional
Easy identification of functional movements.

- The size of the incisal edge has been increased to enable effective side-shift during protrusion movement.
- The distal surface of the upper canines has been developed to obtain the long-centric.
- The incisal edge is morphologically developed to balance the protrusion.
**Easy**  
Short time setting up.

- Stability during the balancing movement.

- Easy mounting for both the “tooth to tooth” and the “tooth to 2 teeth” concept.

**Smart**  
Innovative in the idea and use.

- Dentures can be produced with individualized angle of the upper and lower cusps.

- Molars with variable occlusal inclination between 30° and 40°.

- Identify the crown axis of the back teeth and easy mounting in the centre ridge.
**Durable**
Unchanged occlusion.

- Longer lasting grinding effectiveness, given the specific configuration of the development grooves.
- Occlusal surface with wider cavities, which helps overcome the problem of placing the upper molar palatal cusp in the cavity, both for normal occlusion and in cross-bite mounting.

**Versatile**
Adaptable to all different setting up techniques.

- Given the specific molecular structure of PMMA Ruthinium, the product can be perfectly transformed into lithium disilicate or compressible ceramic.
- With Acry Smart removable dentures or a prosthesis over implants can be made following any gnathologic concept.

"Grooves unchanged even in the case of abrasion or wear to the cusps."
